

Study of the $e^+ e^- \rightarrow \pi^+ \pi^- \pi^0$ process with the CMD-3 detector at the VEPP-2000

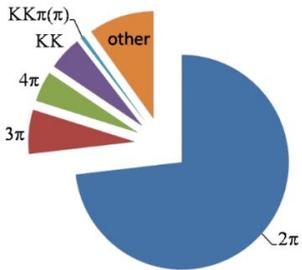

S. Tolmachev on behalf of the CMD-3 collaboration (BINP, Novosibirsk)
21st Lomonosov Conference, Moscow 2023

Motivation, goals, data set

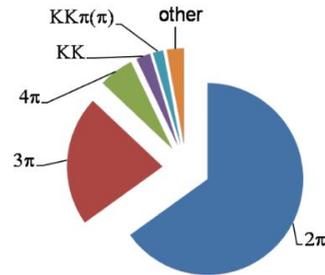

- Cross-section of $e^+ e^- \rightarrow \pi^+ \pi^- \pi^0$ is the second significant contribution to the hadronic part of the $g-2$ and its uncertainty
- Difference between CMD-2 and SND measurements of peak cross-section (~ 130 nb) contributes significantly to uncertainty of hadronic part of $g-2$

Value

Square of uncertainty

- Measurement of ω -meson parameters
- Study of dynamics, particularly measure ρ - ω interference

Data set:

- $E_{\text{c.m.}} = 0.66 - 0.97$ GeV
- 2 seasons (2013, 2018)
- 4 scans at energy region close to ω -meson mass
- 101 energy points
- $L_{\text{int}} \approx 51.4 \text{ pb}^{-1}$ (2013,2018)

Selection criteria

Good track:

- $N_{\text{hits}} > 10$ (Number of hits in DC)
- $1.1 < \theta < \pi - 1.1$ [Rad] (Polar angle of track)
- $\rho < 0.2$ [cm] (Distance to beam axis)
- $|z| < 10$ [cm] (Distance to interaction point along the beam)
- $dE_{\text{dx}} < 6000$ (Energy loss in DC)
- $0.2 < P/E_{\text{beam}} < 0.8$
- $N_{\text{good tr}} = 2$
- $Q_1 + Q_2 = 0$ (Oppositely charged tracks)
- $N_{\text{good } \gamma} \geq 2$
- $0.25 < |\Delta\phi| < \pi - 0.25$ (Acollinearity in the azimuthal plane)
- $0.4 < (P_1 + P_2)/2E_{\text{beam}} < 0.73$

Good γ :

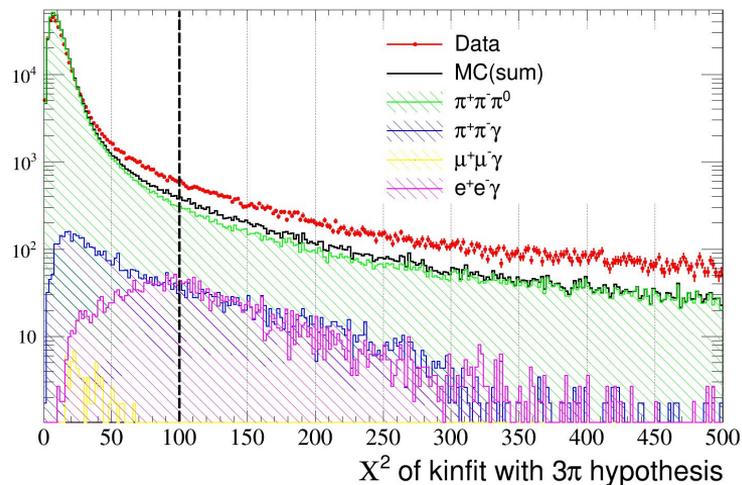

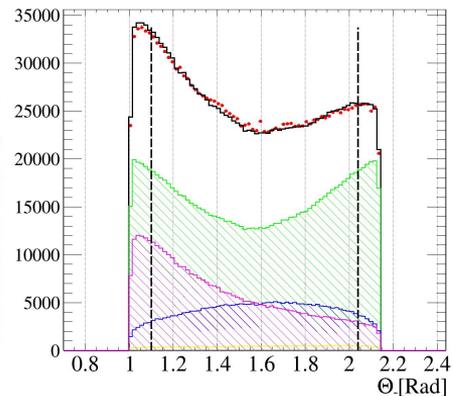

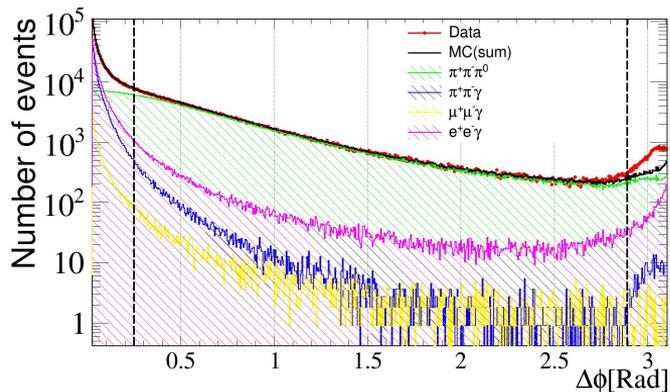

- $E_{\gamma} > 50$ MeV
- $0.5 < \theta_{\gamma} < \pi - 0.5$

Kinematic fit:

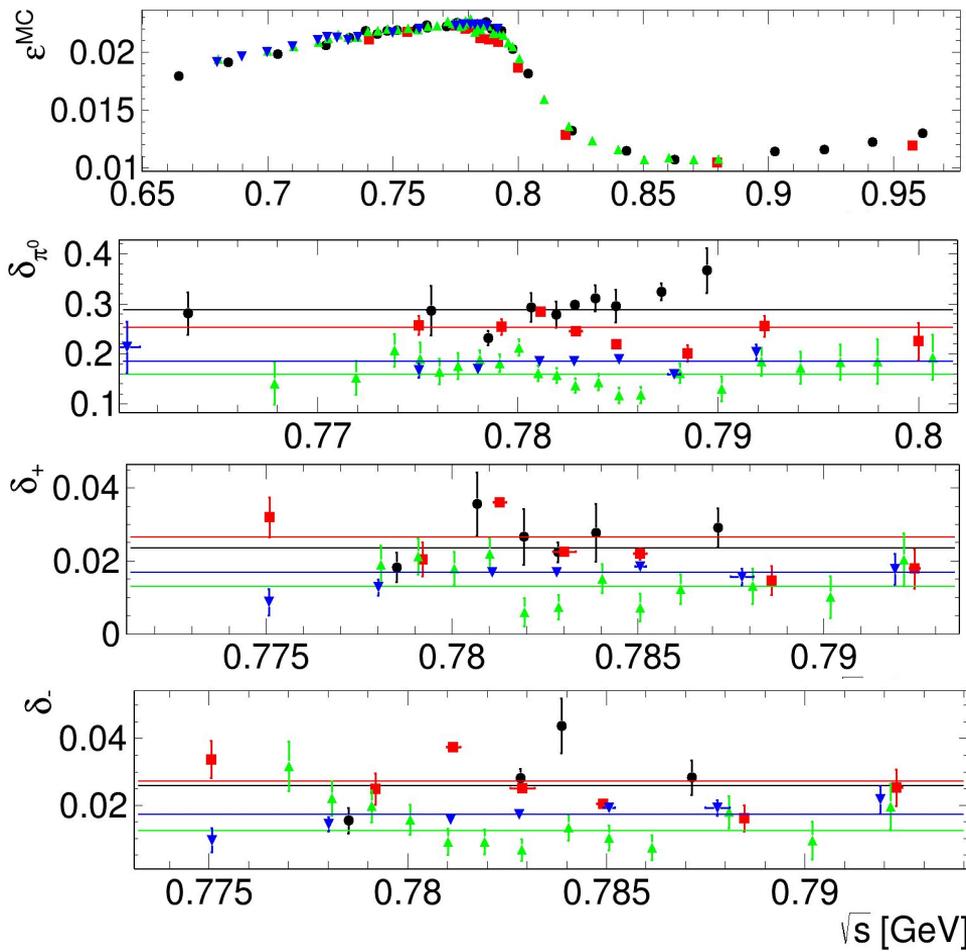

- $\chi^2_{3\pi} < 100$
- $\chi^2_{3\pi} > 40$
- $\chi^2_{\pi\pi\gamma} > 200$
- $\chi^2_{\mu\mu\gamma} > 100$

Background:

- $\pi^+\pi^-\gamma$
- $e^+e^-\gamma$
- $\mu^+\mu^-\gamma$

Efficiency and corrections

$$\epsilon_{MC} = \frac{N_{MC}^{sel}}{N_{MC}^{tot}}$$

$$\delta_{\pi^0} = 1 - \frac{\epsilon_{\pi^0}^{Data}}{\epsilon_{\pi^0}^{MC}}$$

$$\epsilon_{\pi^0} = \frac{N_{\pi^+\pi^-\pi^0}}{N_{\pi^+\pi^-}}$$

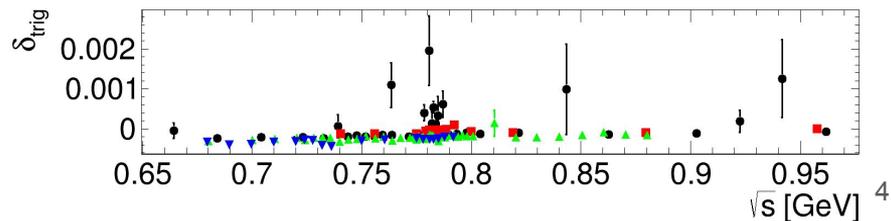

$$\delta_{\pm} = 1 - \frac{\epsilon_{\pm}^{Data}}{\epsilon_{\pm}^{MC}}$$

$$\epsilon_{\pm} = \frac{N_{2tr,\pi^0}}{N_{2tr,\pi^0} + N_{1tr\pm,\pi^0}}$$

- scan2013_rho
- scan2013_omphi
- ▲ scan2018
- ▼ scan2018_omphi

$$\sigma_{vis} = \frac{N_{3\pi}}{L\epsilon_{MC}(1 - \delta_{\pi^0})(1 - \delta_+)(1 - \delta_-)(1 - \delta_{trig})}$$

- Number of signal was determined from the missing mass distribution fit
- Detection efficiency $\sim 2\%$
- π^0 reconstruction correction 15 - 30 %
- Track reconstruction correction 1.5 - 3%
- Trigger correction less than 0.1%
- At points where there were not enough statistics to determine the corrections, the average for the scan was taken

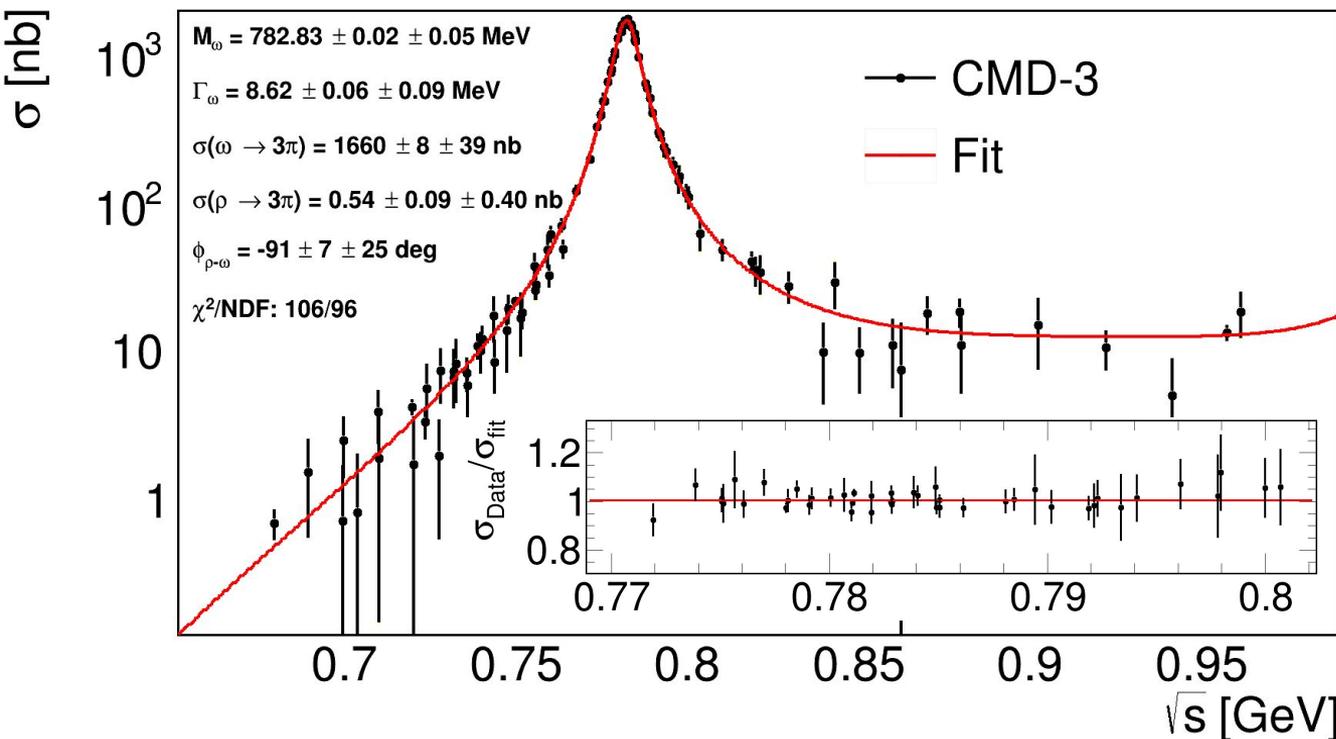

Cross-section approximation

$$\sigma(s) = \frac{F_{3\pi}(s)}{s^{3/2}} \left| \sum_{V=\rho,\omega,\phi,\omega',\omega''} e^{i\phi_{\omega V}} \sqrt{\frac{\sigma(V \rightarrow 3\pi) M_V}{F_{3\pi}(M_V^2)} \frac{\Gamma_V M_V^2}{D_V(s)}} \right|^2$$

$$F_{3\pi}(s) = \frac{(4\pi\alpha)^2 \sqrt{s}}{12\pi} \int [\vec{P}_+ \times \vec{P}_-]_{\perp}^2 \left| \sum_{i=0,+,-} \frac{g_{\rho^i \pi \pi}}{D_{\rho^i}(P_{\rho^i}^2)} \right|^2 d\Phi_{3\pi}$$

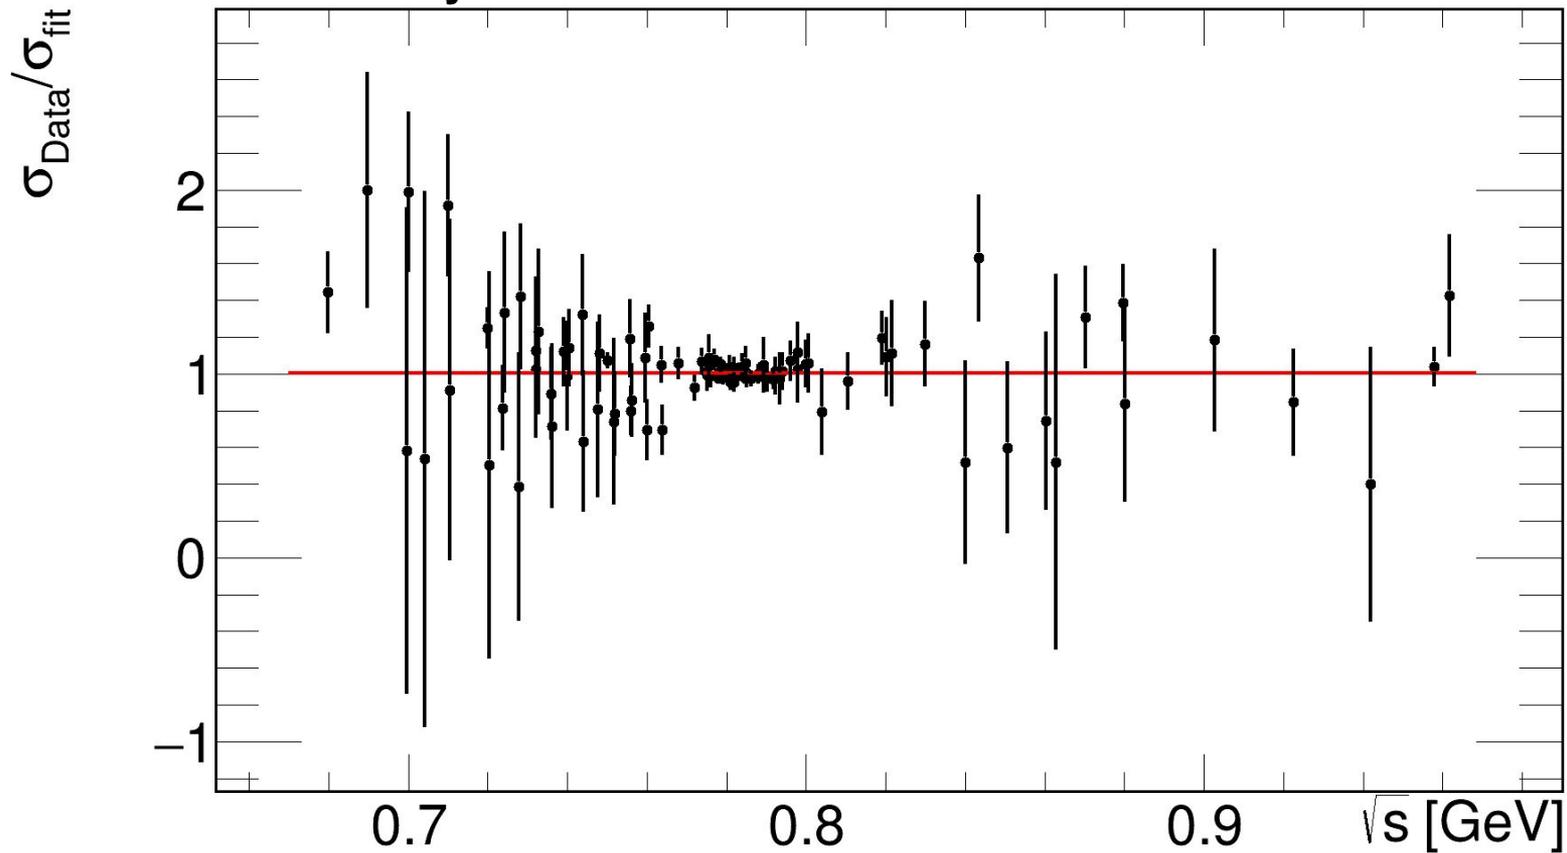

Preliminary fit ($E_{\text{c.m.}} = 0.66 - 0.97 \text{ GeV}$)

- Phase space includes only $\rho\pi$ mechanism
- The energy dependence of the widths is included
- In the approximation $\rho, \phi, \omega', \omega''$ masses and widths were fixed at their PDG values.
- $\omega - \phi$ phase was fixed at 167°
- $\omega - \omega'$ phase was fixed at 90°
- $\omega - \omega''$ phase was fixed at 180°

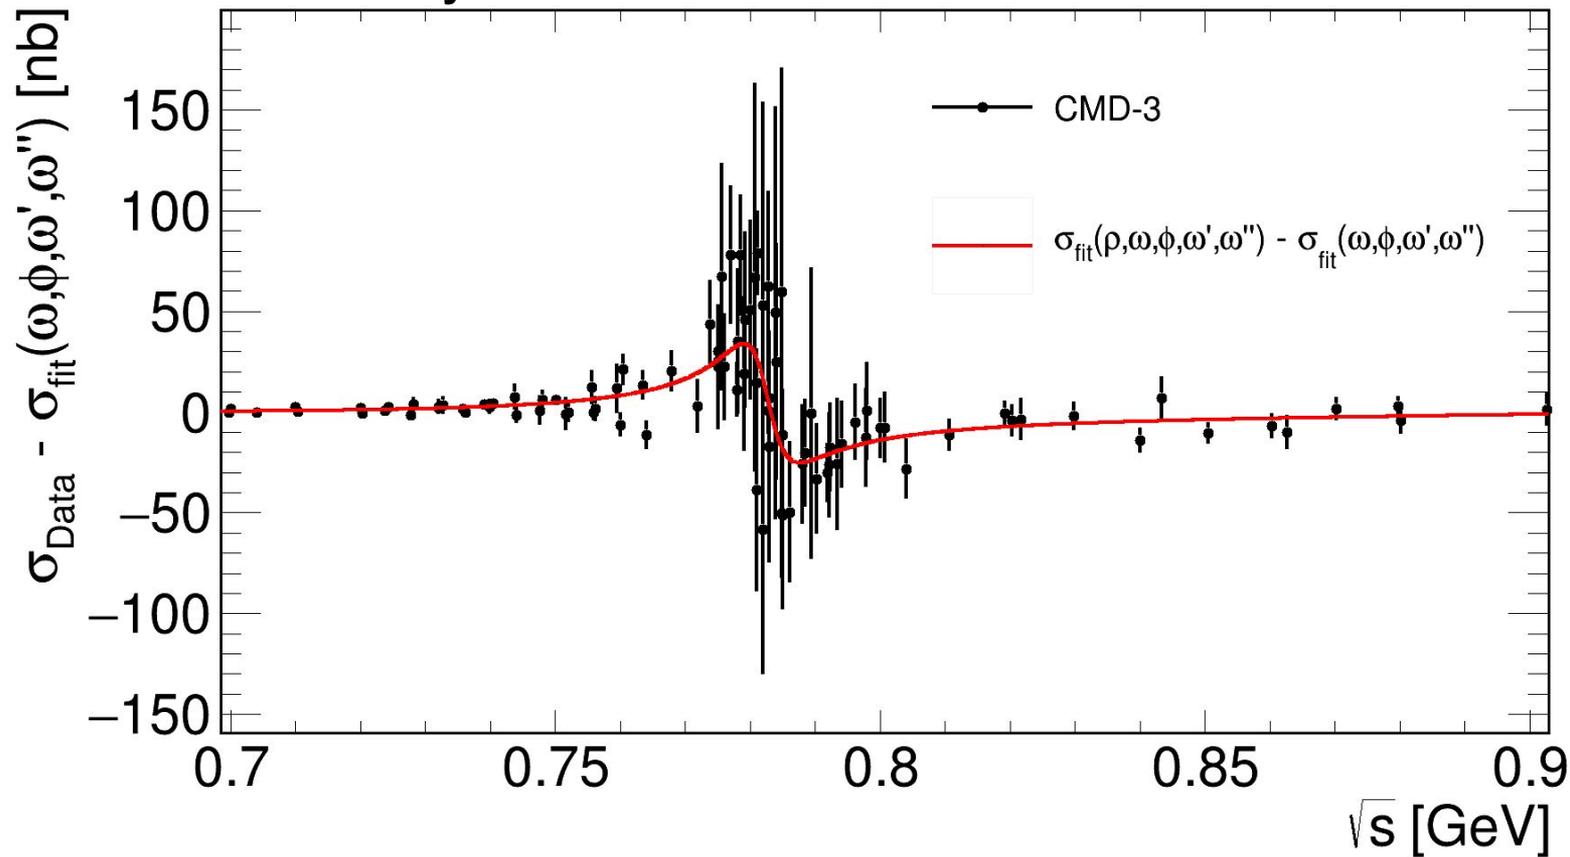

$N_{3\pi} \approx 480\text{k}$

Preliminary

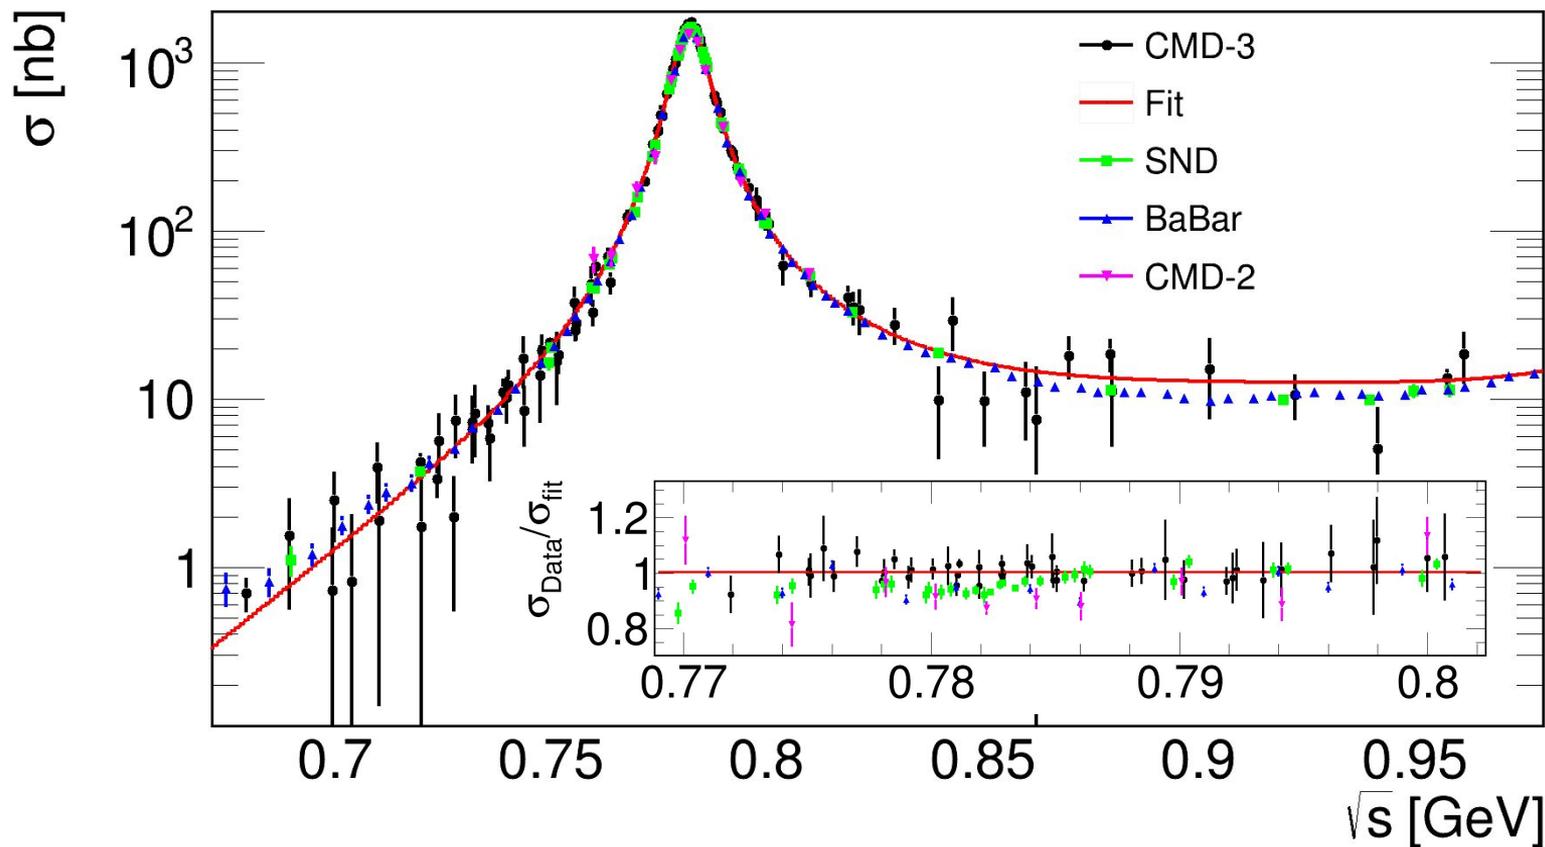

Cross-section without ρ -meson part

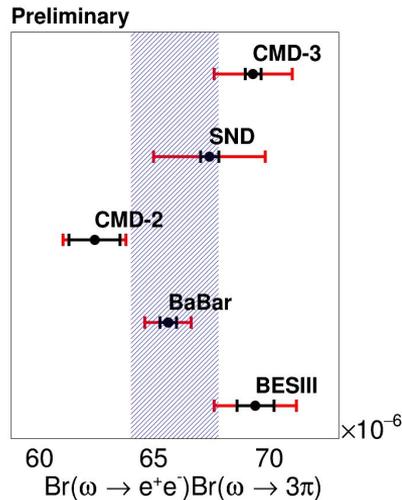

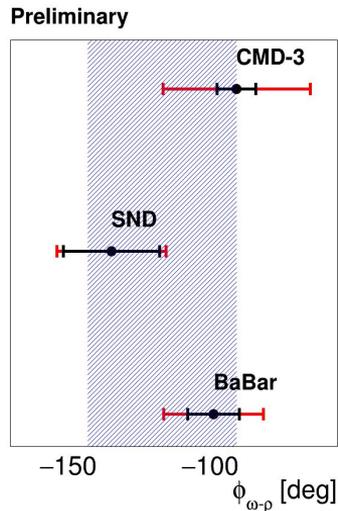

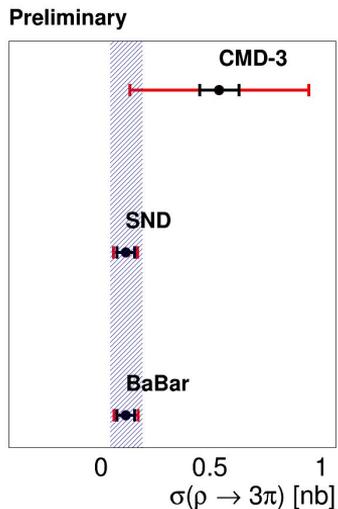

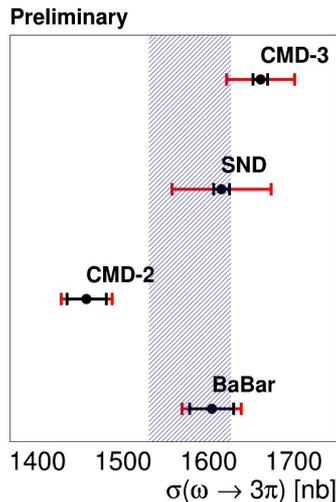

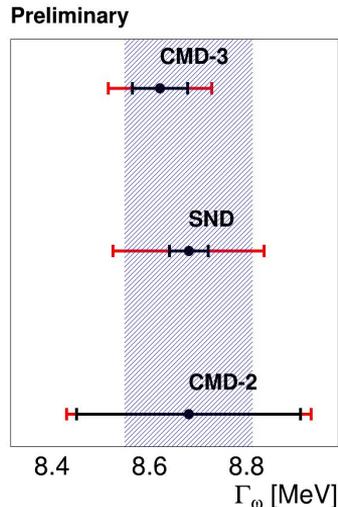

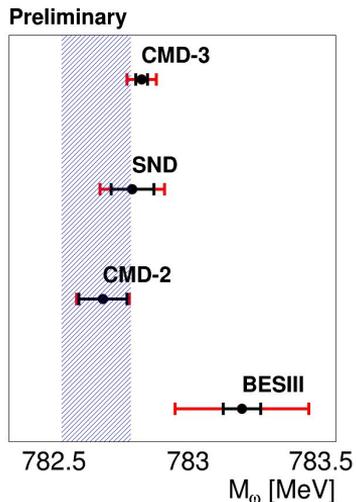

Preliminary

Comparison with other experiments

Preliminary

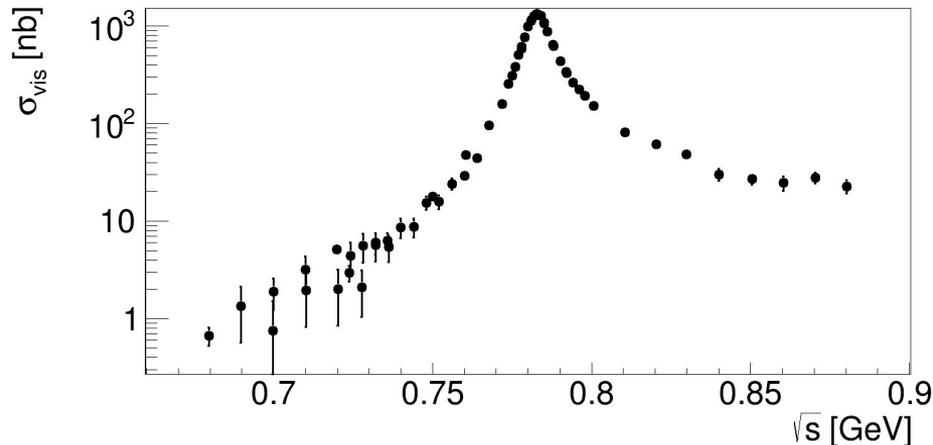

Cross-section systematic uncertainty sources:

| | |
|------------------------|--------------|
| Luminosity | 1.5 % |
| θ cuts | $\sim 1\%$ |
| Kin fit χ^2 cuts | $\sim 1\%$ |
| Photons cuts | $\sim 1\%$ |
| π^0 reconstruction | $\sim 0.5\%$ |
| Tracks reconstruction | $\sim 0.2\%$ |
| Total | $\sim 2.4\%$ |

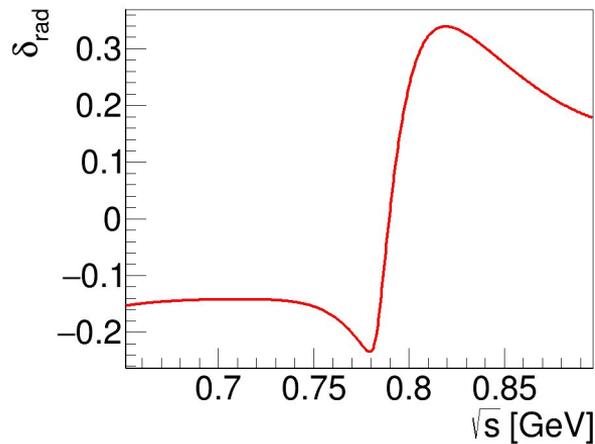

Summary

- Analysis results are in agreement with previous measurement
- Parameter uncertainties are determined by systematics
- Analysis in ϕ - meson region is in progress
- We are optimistic about reducing the systematics
- The work was supported by grants: the Russian Science Foundation No 23-42-10025; the Belarusian Republican Foundation for Basic Research No. F23RSF-118.

Backslides(Visible cross-section and radiative correction)

- Born cross-section was calculated with the precision 0.2%
- Fadin - Kuraev function

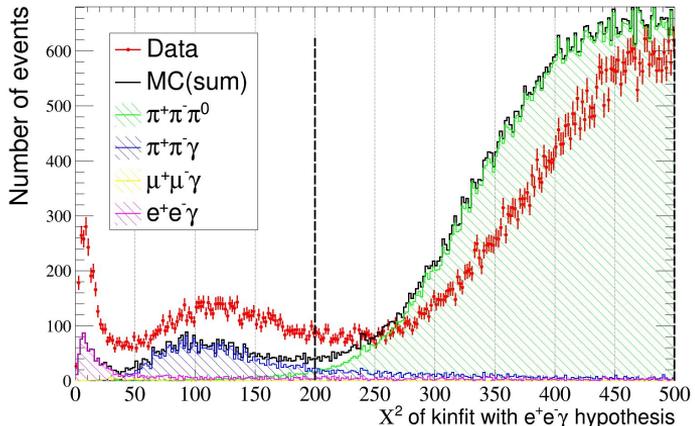

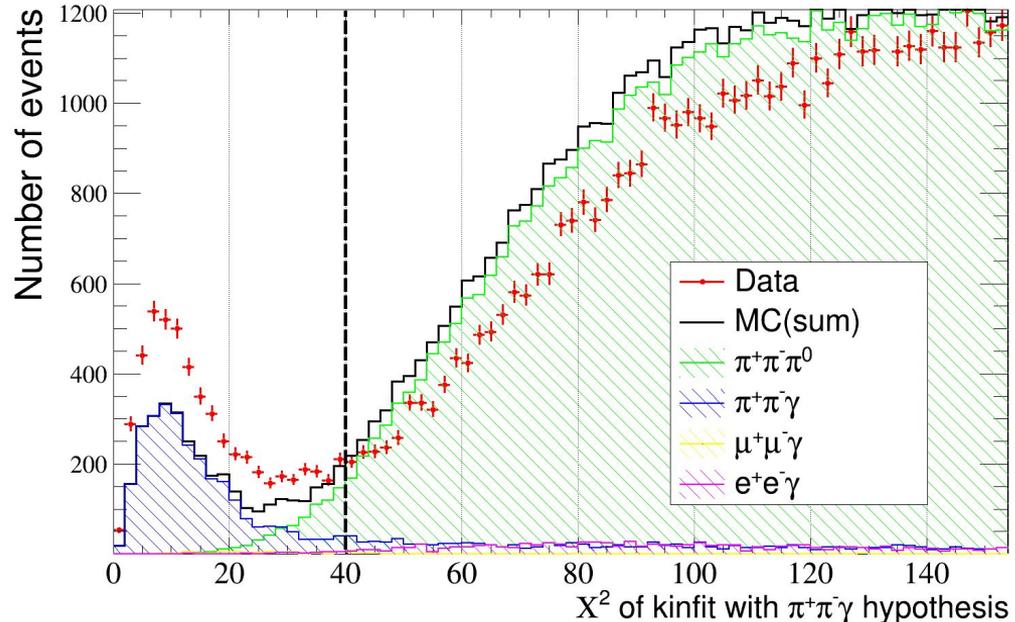

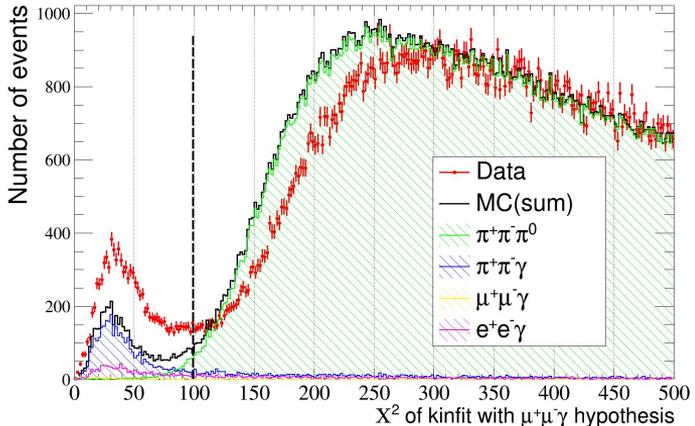

$$\sigma_{vis} = \frac{N_{3\pi}}{L\epsilon_{MC}(1 - \delta_{\pi^0})(1 - \delta_+)(1 - \delta_-)(1 - \delta_{trig})}$$

$$\sigma_{vis}(s_0) = \int_{-\infty}^{\infty} e^{-\frac{(s-s_0)^2}{2\sigma_s^2}} ds \int_0^{x_0} \sigma(s(1-x))F(x,s)dx$$

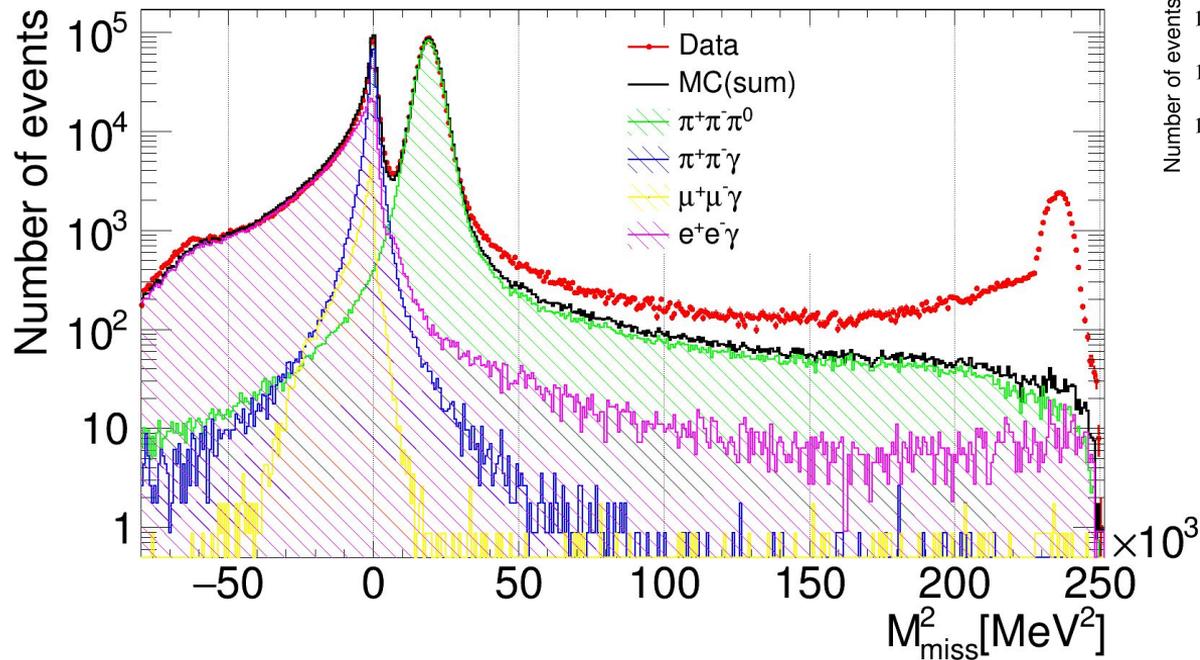

$$\sigma(s) = \frac{\sigma_{vis}(s)}{(1 + \delta_{rad})}$$

Backslides (Chi2 cuts)

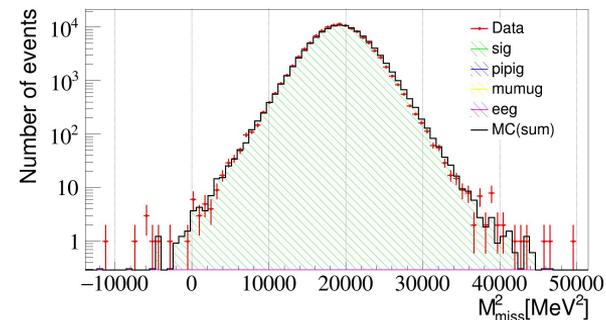

Backslides (Missing mass before cuts)

Only two opposite charged tracks

All selection criteria applied

After selection almost no background but low efficiency
