OUTLINE

- Motivation
- QC₂D, lattice setup
- Confinement-deconfinement transition at low temperature
- Gluon propagators
- Conclusions

Motivation

- There are still problems with getting solid results in lattice QCD at nonzero μ_B (sign problem)
- Study of SU(2) QCD should help to check various methods and approaches to real QCD :
 - 1) lattice methods (analytic continuation, Taylor expansion, etc.) can be checked
 - 2) predictive power of other approaches (DSE, FRG, ChPT, effective actions,...) to nonperturbative QCD by comparison of their results for QCD-like theories with respective lattice results
 - 3) SU(2) QCD reflects some properties of real QCD

Lattice studies of QC_2D

Dedicated workshop YITP workshop ‘Probing the physics of high-density and low-temperature matter with ab initio calculations in 2-color QCD’, 2020

Recent review **Viktor Braguta**, Phase Diagram of Dense Two-Color QCD at Low Temperatures, [Symmetry 2023, 15, 1466](#).

Phase Diagram of QC_2D at $T=0$

At small μ this phase diagram is supported by CHPT, Lattice results, ...

Lattice setup I

- $SU(2)$ lattice QCD with $N_f = 2$ flavors of staggered Dirac operator
- Lattice size 40^4 and 32^4
- Lattice spacing $a = 0.048$ fm (fixed by $r_0 = 0.468$ fm)
- Pion mass $m_\pi = 680(40)$ MeV
- $L_1 = 1.92$ fm, $T_1 = 103$ MeV; $L_2 = 1.54$ fm, $T_2 = 128$ MeV
- $0 \leq \mu_q \lesssim 2000$ MeV ($0 \leq a\mu_q \leq 0.5$)

Lattice setup II

$$S_G = \frac{\beta}{2} \left[c_0 \sum_{pl} \text{Re Tr} (1 - U_{pl}) + c_1 \sum_{pl} \text{Re Tr} (1 - U_{rt}) \right]$$

$$S_{stag} = \sum_x \bar{\psi}_x \left[\sum_{\mu} \frac{\eta_{x,\mu}}{2} (U_{x,\mu} e^{a\mu_q \delta_{\mu,0}} \psi_{x+\mu} - U_{x-\mu,\mu}^\dagger e^{-a\mu_q \delta_{\mu,0}} \psi_{x-\mu}) + am \psi_x \right] + \sum_x \frac{1}{2} \lambda [\psi_x^T \sigma_2 \psi_x + \bar{\psi}_x \sigma_2 \bar{\psi}_x^T]$$

- $c_0 = 5/3$, $c_1 = -1/12$, $U_{x,\mu}$ are stout smeared variables
- $\eta_{x,\mu}$ - staggered sign function
- $\beta = 1.75$, $am_q = 0.0075$, $\lambda = 0.00075 = \frac{am_q}{10}$

Definitions

Wilson loop

$$W(C) = \frac{1}{N_c} \text{Tr} \left\{ P \exp \left(i \oint_C dx_\mu A_\mu(x) \right) \right\}$$

To compute $V_{\bar{q}q}(r)$ the contour C is

$$\langle W(r, t) \rangle = C_0 e^{-E_0(r)t} + C_1 e^{-E_1(r)t} + \dots$$

$$E_0(r) = V_{\bar{q}q}(r)$$

$$V_{\bar{q}q}(r) = -\lim_{t \rightarrow \infty} \frac{1}{t} \log \langle W(r, t) \rangle$$

Spectral representation of WL

Confinement phase:

Ground state – hadron string for $r < r_{sb}$,

2 static-light mesons for $r > r_{sb}$

We use the fact that WL has very small overlap with s-l mesons state, $C_{sl} \ll 1$

For this reason one does not see string breaking, but clearly see hadron string state

Deconfinement phase:

Ground state – color interaction is screened, Debye screening

Static potentials for 40^4 lattice (T=103 MeV)

Static potentials for 32^4 lattice (T=128 MeV)

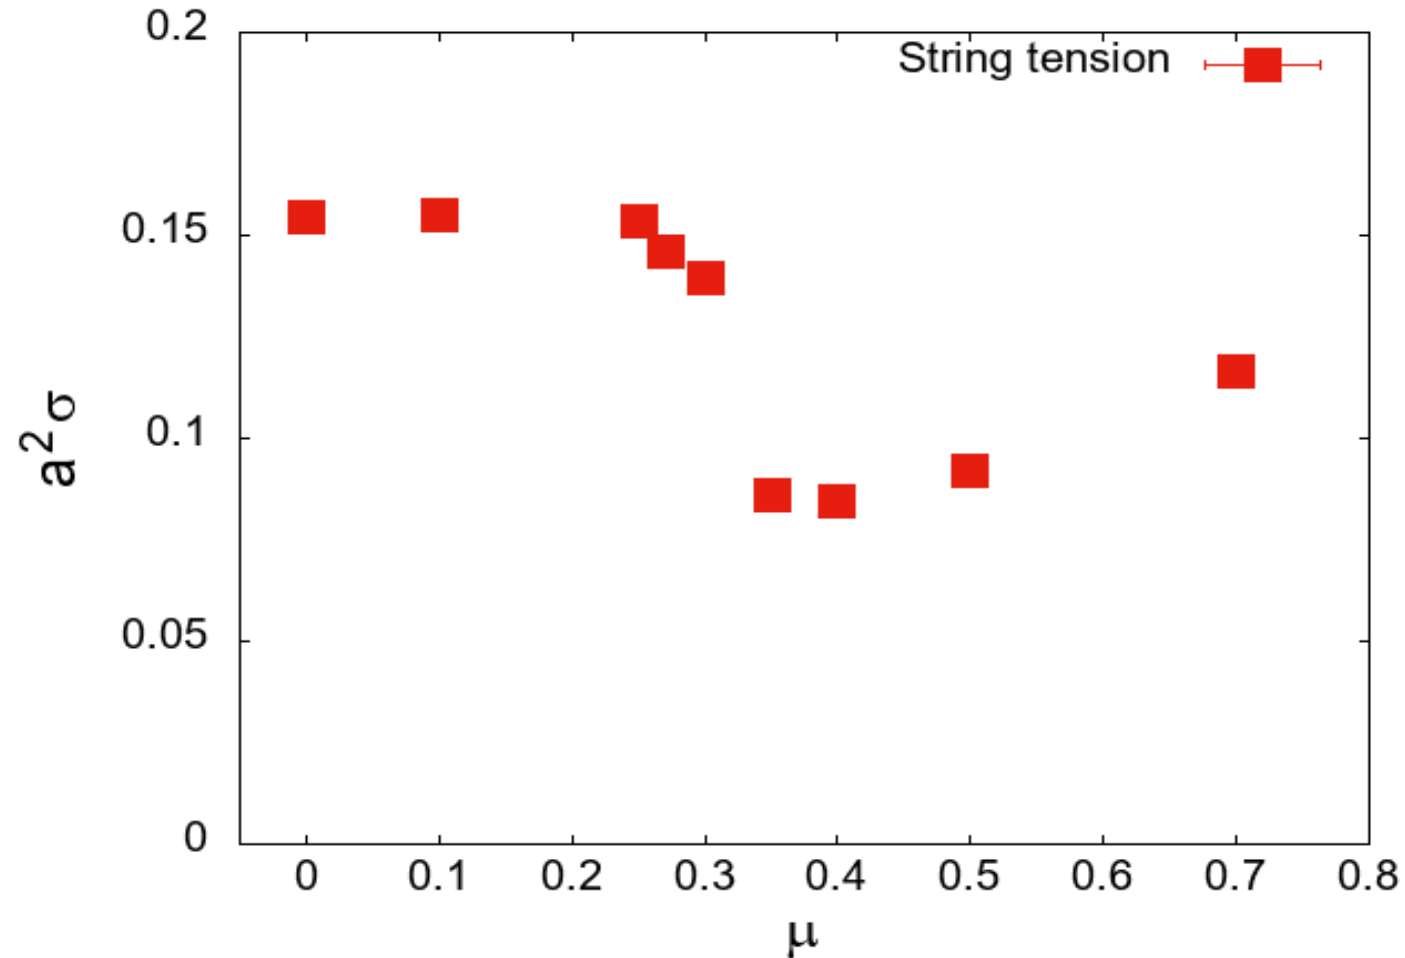

String tension vs. chemical potential

Recent results for Wilson fermion action

The gluon propagators in lattice QC₂D (Landau gauge)

- $N_f = 2$, staggered quarks
- Lattice: 32^4
- $\beta = 1.8$, $a = 0.044$ fm, $L_s \approx 1.4$ fm
- $am_q = 0.0075$, $\lambda = 0.00075$, $m_\pi = 740(40)$ MeV

Ref.: **VB, Braguta, Nikolaev, R.N. Rogalyov**, Effects of Dense Quark Matter on Gluon Propagators in Lattice QC₂, [Phys.Rev.D 102 \(2020\) 114511](#)

Another study: **Boz, Hajizadeh, Maas, Skullerud**, Finite-density gauge correlation functions in QC₂D, [Phys.Rev.D 99 \(2019\) 7, 074514](#)

$D_L(p)$, $D_T(p)$ propagators

Definitions

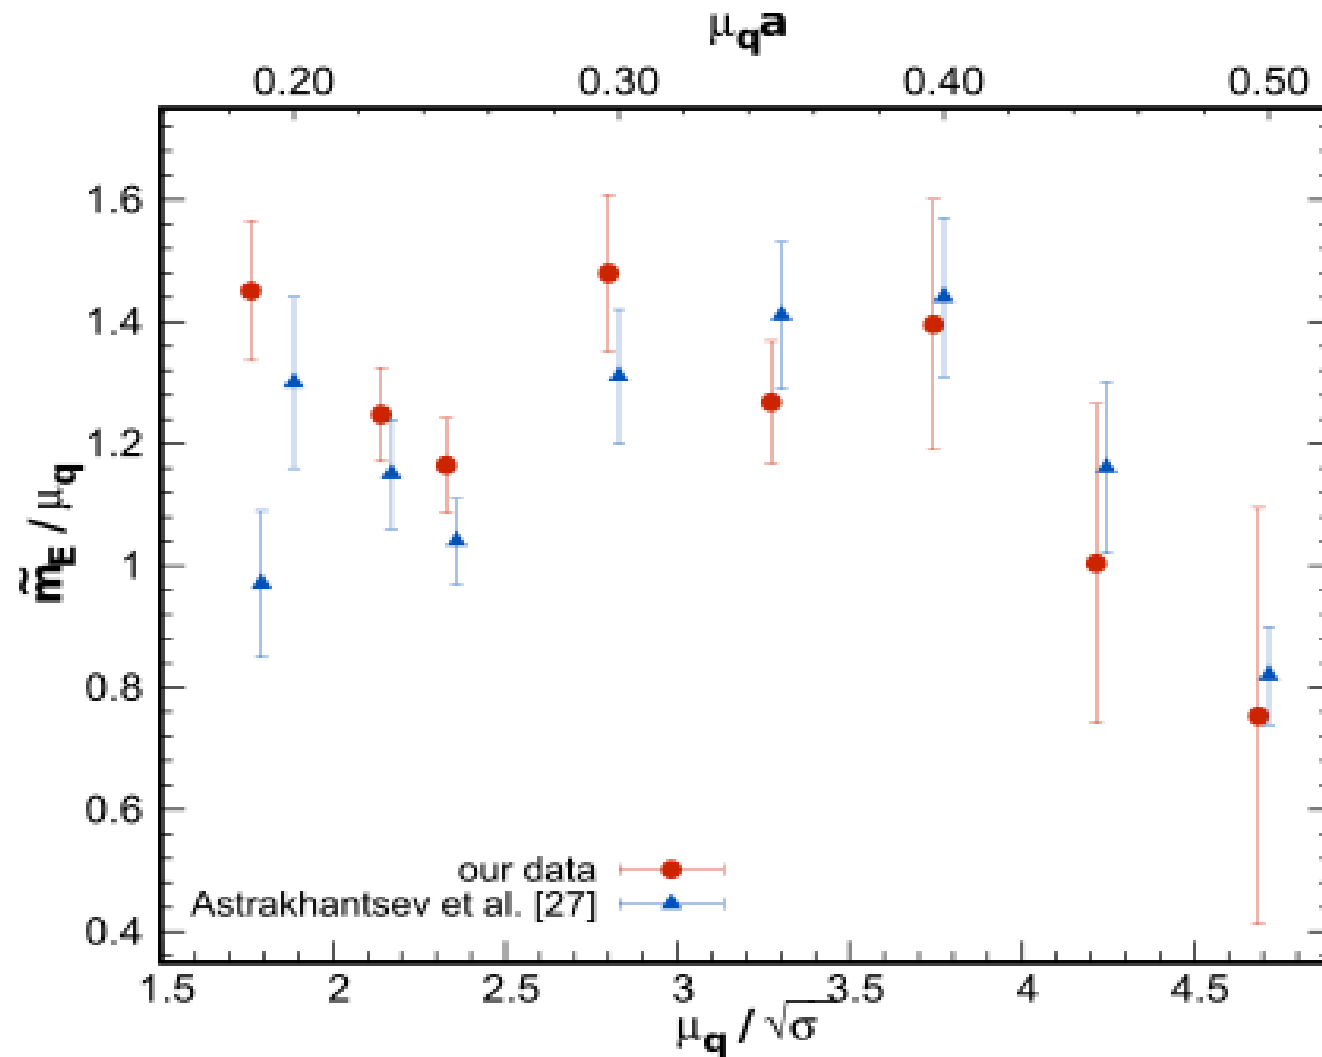

- $m_E^2 = \frac{1}{D_L(0)} \quad m_M^2 = \frac{1}{D_T(0)}$

- $D_{L,T}^{-1}(p) = Z^{-1}(\tilde{m}_{E,M}^2 + p^2 + c_4 \cdot (p^2)^2)$

Drastic difference from results of **Boz et al.** for m_E

Comparison of \tilde{m}_E and m_D

Conclusions and Outlook

- Simulations of lattice QC₂D with $N_f = 2$ staggered Dirac operator on large 40^4 and 32^4 lattices with small lattice spacing $a = 0.048$ fm
- String tension, Polyakov loop and its susceptibility were used to locate the deconfinement transition
- The deconfinement transition line was determined in the ranges $800 \lesssim \mu_q \lesssim 1700$ MeV, $100 \lesssim T \lesssim 140$ MeV
- Differences with the Wilson fermions results call for careful checks of lattice artefacts
- Results for the gluon propagator show nontrivial dependence on μ_q contrary to earlier claims
